INTRODUCTION

The rapid changes that are taking place in the world today, both new and existing technologies such as Internet of Thing (IoT), engineering technology, big data, and robots keep playing an influential factor in shaping people's life. Developing and developed nations improve people's living standards through the development of fields between research fields (physics, biology, chemistry, and their application) and science education. Every country that succeeded in making their way to Industry 4.0 and Society 5.0 questioned a new society that discussed these new technologies in all industries and social activities and gained economic development and solutions to social problems in parallel.
